Memorandum for Record

January 16, 2024

Subject: Suitability Determination Memorandum and Antidegradation Assessment for USACE Navigation Operations & Maintenance Dredging of the Grays Harbor Navigation Channel in Grays Harbor County, Washington.

Introduction

This suitability determination memorandum (SDM) and antidegradation assessment documents the consensus regarding the suitability of the proposed dredged material for unconfined aquatic disposal and compliance of the post-dredge leave surface as determined by the Dredged Material Management Program (DMMP) agencies (U.S. Army Corps of Engineers (USACE), Washington Departments of Ecology and Natural Resources, and the U.S. Environmental Protection Agency (EPA)).

Project Description

Accumulated sediment primarily from the Chehalis River but also the Hoquiam, Humptulips, Wishkah, Johns, and Elk rivers settles in the navigation channel, with approximately 3.2 million cubic yards (cy) needing to be removed each year to maintain the authorized depths. Suitable material is dredged by hopper (in most of the outer reaches) or clamshell (in most of the inner reaches) and placed at one of the two estuarine dispersive disposal sites (Pt. Chehalis or South Jetty sites) or is placed in the nearshore areas in Half Moon Bay and South Beach as beach nourishment.

USACE performs O&M dredging in the Grays Harbor Navigation Channel every year. The 2023 sediment characterization is representative of each dredging event within the recency period, each of which may have up to 4 million cy of sediment.

The authorized channel depth ranges from -32 feet (ft) mean lower low water (MLLW) to -46 ft MLLW. A two-foot over-dredge is allowed in all sections (-34 ft to -48 ft MLLW). A summary of the Grays Harbor Navigation Channel characteristics is provided below.

Reach	Start Station	End Station	Authorized Depth (ft MLLW)	Width in Feet	Length in Miles	Side Slopes	
						Right	Left
Outer Reaches							
Bar	0+00.00	280+89	-46	varies up to 1000	5.4	1V:10H	1V:10H
Entrance Channel	280+89	386+89	varies -46 to -40	varies 600 to 1000	1.9	1V:10H	1V:10H
Pt. Chehalis	386+89	463+00	-40	600	1.4	1V:10H	1V:10H
South Reach	463+00	715+28	-38	varies 350 to 600	4.8	1V:5H	1V:5H
Inner Reaches							
Crossover Channel	715+28	871+12	-38	varies 350 to 450	2.8	1V:5H	1V:5H
North Channel	871+12	1000+63	-38	varies up to 350	2.6	varies 1V:5H; 1V:3H	varies 1V:5H; 1V:3H
Hoquiam Reach	1000+63	1159+50	-38	350	3.0	1V:3H	1V:3H

Reach	Start Station	End Station	Authorized Depth (ft MLLW)	Width in Feet	Length in Miles	Side Slopes	
						Right	Left
Cow Point Reach	1159+50	1234+98	-38	varies 350 to 950	1.5	varies 1V:1.5H; 1V:3H	1V:3H
Aberdeen Reach	1234+99	1319+34	-32	varies up to 200	1.6	1V:3H	1V:3H
South Aberdeen	1319+34	1451+53	varies; -32 to -35	varies up to 300	2.5	1V:3H	1V:3H

Project Summary

Waterbody	Grays Harbor
Water classification	Marine
Project rank	Outer Harbor: Very low Inner Harbor: Low Cow Point New Areas: Low Moderate
Total proposed dredging volume (cy)	~3.2 million cy annually (up to 4 million cy)
Authorized dredging depth	Variable -32 ft to -46 ft MLLW
Max. proposed dredging depth (includes 2 feet overdepth)	-34 ft to -48 ft MLLW
Proposed disposal location(s)	Open-water disposal: Point Chehalis, South Jetty; Beneficial use: Half Moon Bay, South Beach
Dredged Material Management Units (DMMUs): No. of stations	8 DMMUs in Outer Harbor from 10 grab stations 28 DMMUs in Inner Harbor from 148 grab stations 4 DMMUs in Cow Point New Areas from 4 coring stations
DMMO tracking number	GRAYS1AF454
EIM Study ID	GRAYS23
USACE Regulatory Reference Number	Not applicable
Sampling and Analysis Plan (SAP) Approval Date	July 10, 2023 (EcoAnalysts 2023)
Sampling Date(s)	July 18 – 24, 2023
Sediment Characterization Report Approval Date	January 12, 2024 (EcoAnalysts 2024)
Testing Parameters	DMMP Marine COCs plus dioxins/furans (D/F)
Biological Testing	Bioassay testing not required
Suitability Outcome	All material found suitable for in-water disposal
Recency Expiration Date VL=10 years; L= 7 years;	Outer Reaches: July 2033 Inner Reaches: July 2030 Cow Point New Areas: Not applicable
Antidegradation Assessment	In compliance

Sampling and Analysis Description

The sampling design was similar to the 2012 sediment characterization which included volume-based DMMUs in the outer reaches and distance-based DMMUs in the inner reaches. Additional sampling was conducted in Cow Point to support a feasibility study on potential turning basin modifications. Sampling locations were selected in areas with dredged material (e.g., shoals) based on a March 2023 bathymetric survey conducted by USACE. Table 1 provides the sampling design for the 2023 sediment characterization. Figure 1 provides an overview of the Grays Harbor inner and outer reaches. The sediment characterization report contains detailed figures with target and actual sampling locations (EcoAnalysts, 2024).

Power grab and vibracore sampling were conducted by EcoAnalysts and Gravity Consulting from July 18 to July 23, 2023 from the R/V Ingalls and R/V Cayuse. Outer reach grabs were collected from the fishing vessel Pearl Necklace. Different vessels were used to safely navigate the different reaches. Table 2 provides the date and time samples were collected along with the actual sampling station coordinates and the distance from the target sample location. Table 3 and Table 4 provide additional details such as measured water depth, tidal stage, MLLW, penetration, percent recovery, and sampling depth intervals. Table 5 provides the DMMU sample compositing plan.

Horizontal positioning was determined by an onboard real time kinematic global positioning system (RTK GPS) based on target coordinates. After navigating to a target sample station and confirming the correct location, the actual water depth was measured using a lead line or a calibrated sounder. Real time vertical positioning was determined using the Westport NOAA tide station (9442396). The observed (actual) water level data from the NOAA tide station was used to calculate the mudline elevation (MLLW).

The Grays Harbor Navigation Channel is known to be a rapidly changing environment, so the actual mudline of sampling locations did not match the predicted mudline. Many grab sample stations had to be relocated further than 10' from the target sampling location to find accumulated dredged material. All samples were collected from within the navigation channel. Grab depths varied from 5 to 30 cm due to the different grab sizes used throughout the collection effort. Given the dynamic nature of the project area, all surface material is considered representative of current conditions.

The four cores collected in Cow Point met % recovery goals; however, two locations did not reach the 10 ft target depth (7 ft and 8.5 ft). Since these samples were exploratory only, data quality objectives were still met.

Data Validation

EcoChem conducted an EPA Stage 2B review and validation of all DMMP chemistry data and an EPA Stage 4 review of 10% of the D/F results. The validation process resulted in some additional J and UJ qualified data (estimated values) and U qualified data (estimated maximum possible concentrations [EMPCs] and analytes associated with method blank detections) beyond those assigned by the lab, based on specified protocol or technical advisory. Due to laboratory quality assurance/quality control (QA/QC) issues, some analyses were re-extracted and/or re-analyzed to meet project data quality objectives (DQOs). In these instances, the data associated with passing QA/QC or that met the project DQOs (i.e., method detection limits [MDLs] below screening levels [SLs]) were used and the original results were qualified as "Do Not Report" to provide just one reportable result per sample parameter. Completeness was 100%; all reported data are usable as qualified.

Table 6 provides definitions of the various qualifiers used by the laboratory and data validator.

Analytical Testing Results

Conventionals and DMMP Chemicals of Concern. Tables 7 through 17 summarize the analytical results for the 40 DMMU composites alongside the DMMP marine guidelines (DMMP, 2021).

The physical characteristics of the outer reaches consisted predominantly of coarse sand with less than 2% fines. The exception is the South Reach sample which contained 29% fines. The percent fines of the inner reach sediment samples increased moving upstream from Crossover Reach (13.7 to 29.6 % fines)

to Cow Point Reach (72 to 81 % fines). Fines decrease in the uppermost reaches (Aberdeen and South Aberdeen) past Cow Point.

Total organic carbon (TOC) in the outer reaches was below 0.5% except for South Reach which was 0.79%. In the inner reaches, TOC generally increases with the % fines content.

Exclusions from testing are allowed if grain size is at least 80% sand and gravel and TOC is less than 0.5%. The outer reaches typically meet the exclusionary guidelines and thus were not sampled or analyzed for chemistry. South Reach usually has more sand but there was little accumulation in this reach and the sample was taken from the shoal on the edge of the DMMU, near the border of the inner Crossover Reach, which has higher fines. Chemical analyses were not triggered for this sample, but chemistry testing in the South Reach should be tiered to conventional testing results for the next sediment characterization.

As seen in previous characterizations, the DMMP chemicals of concern (COCs) were non-detect or at low concentrations in the inner reach samples. All detected COCs were below SLs. All non-detect reporting limits and/or method detection limits (MDLs) were also below SLs except for total chlordane, which had an elevated MDL from matrix interference. Four DMMU samples (DMMU-NC-05, DMMU-HR-04, DMMU-HR-05, and DMMU-AR-01) had MDLs (2.9 to 3.4 µg/kg) that slightly exceed the DMMP SL for total chlordane (2.8 µg/kg). Using historical data and best professional judgment (BPJ), the DMMP determined that reanalysis was not required, and these results would not be managed as typical SL exceedances requiring bioassays.

Dioxins/furans. Tables 8 through 18 provide a summary of the dioxin/furan analyses conducted on sediment from the inner reaches. TEQs were calculated with non-detect values (based on interpretive qualifier) equal to ½ the estimated detection limit.

Results for 2,3,7,8-TCDD ranged from 0.11 (DMMU-SA-05) to 2.30 pprr (DMMU-CP-01) and the TEQs values were from 0.336 (DMMU-SA-02) to 6.55 pprr TEQ (DMMU-CP-01). All results from the inner reach DMMUs were below the current DMMP bioaccumulation trigger guideline value of 15 pprr TEQ for Grays Harbor.

DMMP Determinations

Suitability Determination

Chemical concentrations in the dredge prism composite samples were below the DMMP marine SLs as discussed above. The characterization represented up to 4 million cy of material from the Grays Harbor Navigation Channel. The DMMP agencies have concluded that all the characterized material is suitable for open-water disposal at the Point Chehalis and South Jetty dispersive disposal sites, and for beach nourishment at the Half Moon Bay and South Beach beneficial use sites. Barring changed conditions in the project area (e.g., a spill), the disposal and placement activities covered by this suitability determination for the characterized dredging prism are authorized until the recency expiration date of July 2030 (inner reaches) and July 2033 (outer reaches).

Antidegradation Determination

The sediment to be exposed by dredging must either meet the State of Washington Sediment Management Standards (SMS) or the State's Antidegradation Standard (Ecology, 2013) as outlined by DMMP guidance (DMMP, 2008). Since concentrations of all DMMP chemicals of concern were below the

current marine SLs, the post-dredge surface is considered compliant with the State of Washington Antidegradation Standard.

Cow Point Exploratory Area

Four cores were collected in Cow Point to characterize potential new dredge areas in the turning basin. The shoal area north of the existing turning basin is small and was represented by one core composited into one surface DMMU and one subsurface DMMU. Deeper material was archived in case SL exceedances were found in the subsurface DMMU. The core lithology was fairly uniform and consisted of a gray clay. There was a 1 ft layer of sand/silt/organics (at 7 ft below mudline) that was included in the subsurface DMMU. The surface and subsurface samples had low concentrations, all below SLs. Dioxins and furans ranged from 2.0 to 2.7 ppqr TEQ.

The southern portion of the turning basin was represented by 3 cores composited into one surface DMMU and one subsurface DMMU. The core lithology in this area ranged from gray sandy clay to gray sandy silt with some gravel and cobble at the bottom of two cores. Small bands of organics were observed in some cores. The surface and subsurface samples had low concentrations, all below SLs. Dioxins and furans ranged from 2.6 to 3.1 ppqr TEQ.

If these two areas are added to the navigation channel dredge prism, additional characterization based on the dredge design specifications should be conducted.

Debris Management

The DMMP agencies implemented a debris management requirement following the 2015 SMARM to prevent the disposal of debris (natural or anthropogenic) greater than 12 inches in any dimension at open-water disposal sites in Puget Sound. Debris screens are required unless it can be demonstrated that debris is unlikely to be present or that the debris is large woody debris that can be easily observed and removed by other means during dredging.

Because this area is dredged every year and large woody debris has not been observed during recent dredging events, a debris screen is not required. However, if large woody debris is encountered during dredging a 1 ft by 1ft debris screen should be utilized.

Notes and Clarifications

The decisions documented in this memorandum do **not** constitute final agency approval of the project. During the public comment period that follows a public notice, resource agencies will provide input on the overall project. A final decision will be made after full consideration of agency input, and after an alternatives analysis is done under section 404(b)(1) of the Clean Water Act.

USACE Navigation maintains the appropriate environmental documentation to cover beneficial use at the South Beach and Half Moon Bay beneficial use sites.

Table 6. Laboratory and Validator Qualifier Definitions

Laboratory Qualifier Definitions			
J	Results is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.		
U	Not Detected at the RL (or MDL if shown).		
F1	MS and/or MSD recovery exceeds control limits.		
F2	MS/MSD RPD exceeds control limits		
B	Compound was found in the blank and sample.		
H	Sample was prepped or analyzed beyond the specified holding time.		
q	The reported result is the estimated maximum possible concentration of this analyte, quantitated using the theoretical ion ratio. The measured ion ratio does not meet qualitative identification criteria and indicates a possible interference.		
1	LCS/LCSD RPD exceeds control limits.		
3	ISTD response or retention time outside acceptable limits.		
Validator Qualifier Definitions			
U	The analyte was analyzed but was not detected above the reported sample quantitation limit.		
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.		
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.		
Abbreviations			
SL	Screening Level	MDL	Method Detection Limit
BT	Bioaccumulation Trigger	µg/kg	microgram/kilogram
ML	Maximum Level	mg/kg	milligram/kilogram
RL	Reporting Limit	mg/kg OC	milligram/kilogram organic carbon normalized
SCO	Sediment Cleanup Objective	CSL	Cleanup Screening Level
VQ	Validated Qualifier
