Memorandum for Record **August 28, 2024**

Subject: Suitability Determination Memorandum for the Duwamish Yacht Club project in Seattle, Washington (NWS-2024-639).

Introduction

This suitability determination memorandum (SDM) documents the consensus regarding the suitability of the proposed dredged material for unconfined aquatic disposal and compliance of the post-dredge leave surface as determined by the Dredged Material Management Program (DMMP) agencies (U.S. Army Corps of Engineers, Washington Departments of Ecology and Natural Resources, and the U.S. Environmental Protection Agency).

Project Description

The Duwamish Yacht Club (DYC) is a 112-slip nonprofit yacht club that maintains facilities for the slip owner members along the west bank of the Duwamish River between River Mile 4.0 and 4.2, see Figure 1. There are four floating docks that make up the Yacht Club moorage basin. Routine maintenance dredging around the docks is necessary for the structural integrity of the floating docks and the navigability of the docks at low tide due to substantial deposition in the basin since the last maintenance dredging event in 1998-1999.

The need for maintenance dredging within the DYC was identified in 2011 and a sediment characterization was performed, resulting in a suitability determination by the DMMP agencies in 2013 (DMMP, 2013). The results indicated that a portion of the marina was unsuitable for open-water disposal due to SL exceedances and elevated dioxins/furan concentrations and that further testing would be required to pursue open-water disposal as an option. No maintenance dredging occurred at that time.

A bathymetric survey performed in April 2023 confirmed that additional material had accumulated since 2013 and that maintenance dredging was still needed. The sediment characterization documented in this memorandum was designed to evaluate the suitability of the dredged material that has accumulated within the Yacht Club basin since 2013, and to further evaluate the suitability of the material that required further testing based on the 2013 evaluation.

Project Summary

Waterbody	Duwamish River
Water classification	Marine
Initial Project rank	High
Final Project Rank	High
Total proposed dredging volume (cy)	45,750 cubic yards (CY)
Target proposed dredging depth	-8 ft MLLW
Max. proposed dredging depth (includes no overdepth allowance)	-8 ft MLLW
Proposed disposal location(s)	Elliott Bay non-dispersive disposal site
Dredged Material Management Units (DMMUs): No. of stations	13 DMMUs, 5-9 samples per DMMU. 49 vibracores in total.
DMMO tracking number	DUWYC-1-B-F-451

EIM Study ID	DUWYC23
USACE Regulatory Reference Number	NWS -2024-639
Draft Sampling and Analysis Plan (SAP) Submittal Date	July 10, 2023
Sampling and Analysis Plan (SAP) Approval Date	August 29, 2023
Sampling Date(s)	September 5 – 13, 2023
Testing Parameters	DMMP standard marine COCs plus Dioxins/Furans
Biological Testing	Marine bioassays triggered on 4 DMMUs
Suitability Outcome	28,300 CY from DMMUs 1-8 and 11 are suitable for open-water disposal at the Elliott Bay disposal site. 16,500 CY of material from DMMUs 7, 9, 10, 12 and 13 are unsuitable for open-water disposal.
Recency Expiration Date (high = 3 years)	September 2026

Sampling and Analysis Description

Sediment samples were collected by vibracore between September 5th and 11th, 2023, aboard the sampling vessel *R/V Cayuse* provided by Gravity Consulting. The DMMU design was developed to reduce testing costs by focusing on testing the newly deposited material and the material in the areas closest to the Hamm Creek outfall that required further testing to determine suitability.

The 2013 characterization included testing sediment to a depth of -8 ft MLLW throughout the marina. For the 2023 characterization, several special considerations were made in the DMMU design:

- The target proposed dredge elevation in the DMMUs on the south side of the yacht basin was increased by a foot to –9 ft MLLW to accommodate a 1-ft layer of sand placement.
- An additional subsurface DMMU on the southern side of the yacht basin was characterized to a depth of -13 ft MLLW. The purpose of this DMMU was to provide additional material for dioxin volume-weighted averaging, if needed, and to provide DYC with additional depth in the area with highest shoaling to lengthen the time between dredging events.
- Only confirmational sampling of DMMUs 2 and 3 was required, based on the 2013 sampling results. These DMMUs have been buried by sedimentation since then.
- More than the minimum required number of samples per DMMU were collected in some areas in order to collect sufficient volume of sediment for all potential biological testing scenarios.

Figure 2 shows the proposed and actual sediment sampling locations and Figures 3-5 show the surface, subsurface and second subsurface DMMUs, respectively. Table 1 lists the sampling station details and Table 2 shows the compositing scheme. The most notable deviations from the sampling and analysis plan are noted below:

- Multiple attempts were made at core locations C34 and C38, but full depth samples were not collected due to refusal on a dense sandy layer. The subsurface DMMU intervals were short and no z-layers were collected for these cores.
- Core interval of C48-B was short, resulting in the subsurface DMMU portion of this core only including material from -6 to -8 ft MLLW, instead of -6 to -9 ft MLLW.
- The z-sample interval from C46 was inadvertently collected from -9 to -12 ft MLLW, one foot deeper than planned.
- Three cores were added to the sampling plan in the field in order to ensure sufficient material was collected from DMMUs 8, 10, and 12.

- Several cores were moved more than 2 m from the target location in order to collect acceptable cores. C2 was moved to avoid riprap, C34 and C38 were moved to avoid the dense sandy clay subsurface layer.
- Due to a processing error, C4-B subsurface and z-sample intervals were shifted 0.5 ft deeper than planned.
- Photographs of core segments C1-B, C1-Z, C23-A and C39-A were inadvertently not collected.

When possible, deviations from the approved Sampling and Analysis Plan (Integral, 2023) were coordinated with the DMMP agencies. After reviewing the information provided, the DMMP agencies determined that the samples collected were representative of the proposed dredged material and are considered sufficient for decision-making. Samples were submitted to Analytical Resources in Tukwila, Washington for analysis. Analyses were performed by Analytical Resources, Pacific Rim Labs, located in Surrey, British Columbia, and AmTest Laboratories in Kirkland, Washington. Biological testing was performed by EcoAnalysts in Port Gamble, Washington.

Data Validation

An EPA Stage 2b data validation was performed by EcoChem of Seattle, WA on all data. In addition, Stage IV validation was conducted on 10% of the dioxin/furan data. The validation process resulted in some additional J and UJ qualified data beyond those assigned by the laboratory, based on specified protocol or technical advisory. Completeness was 100% and all data were considered usable, as qualified, by the data validator.

Additional validation details:

- Pesticide results from SDG PR232591 were received at the analytical laboratory with a cooler temperature of 15C, more than twice the upper control limit. Associated field results were J-flagged.
- Antimony results from SDGs 23I0277, 23I0178 and 23I0276 were rejected due to percent recovery less than 10% and no post-spike sample analysis. Samples were re-analyzed with an acceptable post-spike recovery and re-analyzed results are reported here.

Analytical Testing Results

Results of the sediment characterization are reported in the sediment characterization report (Integral, 2024). Sediment conventional results show that the material was classified as silts and sandy silts with total fines content ranging from 40.9 to 86.2%, see Table 3. Total organic carbon ranged from 1.05 to 3.66%. Total sulfides were elevated in many of the samples, ranging from 853 to 7550 mg/kg and averaging at 3710 mg/kg total sulfides.

Table 4 summarizes the analytical results for all 13 DMMUs and z-samples alongside the DMMP marine guidelines. There were detected SL exceedances in six DMMUs. Benzoic acid was above the SL in DMMU 4, benzyl alcohol was above the SL in DMMUs 7 and 9, butyl benzyl phthalate was above the SL in DMMU 10, and dimethyl phthalate was above the SL in DMMU 10, 12, and 13. All other COCs were below SLs except for dioxins/furans, which are discussed below.

Exceedances of benzoic acid in DMMU 4 and benzyl alcohol in DMMU 7 were not discovered until final validated data was received, which occurred well past expiration of the bioassay holding time. Therefore, the DMMP agencies allowed analysis of individual composite samples for benzoic acid in DMMU 4 and benzyl alcohol in DMMU 7, results are shown in Table 5.

All individual archive analyses of benzoic acid in DMMU 4 were below the SL and comparable to benzoic acid results for the rest of the marina. Based on the similarity to other results, uniformity of results seen the individual archive analyses and the often transient nature of benzoic acid, the DMMP agencies determined that the individual archive results were appropriate for decision-making on DMMU 4.

The individual archive results of benzyl alcohol in DMMU 7 were mixed, with half of the results above the SL and half below. The DMMP agencies reviewed the results and determined that the majority of the DMMU was unsuitable for open-water and that only a small portion on the eastern side could be separated and considered suitable, see Figure 7.

TBT. Tributyltin analysis was not required by the DMMP for this project based on the site history and location of the project.

Dioxins/furans. Dioxin analysis was required by the DMMP for this project based on previous results. Complete dioxin/furan results are shown in Table 4 and a summary of dioxin results is in Table 6. Four DMMUs had dioxin concentrations less than the DMMP disposal site management objective of 4 pptr TEQ. Six DMMUs had dioxin concentrations above the disposal site management objective, but less than the bioaccumulation trigger of 10 pptr TEQ, and three DMMUs had dioxin concentrations above the bioaccumulation trigger.

Table 7. Dioxin volume-weighted averaging for Duwamish Yacht Club (dredging to -8 ft MLLW)

DMMU	DMMU Volume[a] (cubic yards)	Dioxin/Furan TEQ (ND=1/2 DL) (pptr)	In-Water Disposal Volume × TEQ (cy-pptr)	
1	3,000	5.18	15540	
2	2,850	4.15	11828	
3	3,450	4.23	14594	
4	4,350	4.52	19662	
5	4,050	3.33	13487	
6	4,350	2.77	12050	
7	900	8.47	7623	
8	3,200	2.67	8544	
11	2,150	6.46	13889	
	28,300		**4.1**	**pptr TEQ VWA dioxin concentration**

Notes:

DL = detection limit

DMMU = dredged material management unit

ND = non-detect

pptr = parts per trillion

TEQ = toxicity equivalence

[a] Volume estimated based on the federal navigation channel boundaries, total dredge elevation, and a 1V:1.5H side slope.

Based on these results, DYC initially chose to pursue bioaccumulation testing for dioxins. However, once the bioassay results were received, DYC chose to suspend bioaccumulation testing and instead use volume-weighted averaging for dioxins.

Volume-weighted averaging for dioxins is allowed for DMMUs with dioxin concentrations between 4 and 10 pptr TEQ as long as the final VWA concentration meets the disposal site management objective of 4 pptr TEQ. Table 7 below shows the dioxin VWA for DMMUs 1 – 6, the suitable portion of DMMU 7 that passed the benzyl alcohol SL, and DMMUs 8 and 11. The VWA dioxin concentration is slightly above, 4.1 compared with the site management objective of 4 pptr TEQ. The DMMP agencies consider 4.1 pptr TEQ to be within the analytical uncertainty of 4 and less than Ecology's PQL for dioxins/furans of 5 pptr TEQ.

Biological Results

Due to SL exceedances based on preliminary data, bioassays were triggered in DMMUs 9, 10, 12 and 13. The standard suite of three marine bioassays were conducted by EcoAnalysts of Port Gamble, Washington using *Neanthes arenaceodentata* for the infaunal growth test, *Mytilus galloprovincialis* for the larval test, and either *Eohaustorius estuarius* or *Leptocheirus plumulosus* for the amphipod test. Two reference samples from Carr Inlet were collected in order to provide suitable grain size matches (see Figure 6 and Table 8).

The initial round of amphipod bioassays with *Ampelisca abdita* did not pass the control criterion. After coordination with the DMMP agencies, substitution with *Leptocheirus plumulosus* was allowed given limited commercial availability of *Ampelisca.*

Detailed results of the bioassay tests are shown in Table 9. All bioassays passed the negative control and reference sediment performance standards. There were no significant water quality deviations. The infaunal growth tests all passed with no hits. There was a minor hit (2-hit) in the amphipod test in DMMU 12 and a major hit (1-hit) in DMMU 13. All four DMMUs had major hits (1-hit) in the larval development bioassay.

	Amphipod mortality	Juvenile infaunal growth	Larval development	Final determination
DMMU 9	Pass	Pass	1-hit fail	FAIL
DMMU 10	Pass	Pass	1-hit fail	FAIL
DMMU 12	2-hit fail	Pass	1-hit fail	FAIL
DMMU 13	1-hit fail	Pass	1-hit fail	FAIL

If a test sediment has two minor (2-hit) hits or a single major (1-hit) hit then that material is unsuitable for open-water disposal. Therefore, all 4 DMMUs tested failed bioassays and are not suitable for open-water disposal. After receiving the bioassay results, the DYC chose to suspend bioaccumulation testing.

DMMP Determinations

Suitability Determination

Chemical concentrations in the dredge prism composite samples were below the DMMP marine SLs in DMMUs 1, 2, 3, 4, 5, 6, 8 and 11 and these DMMUs are suitable for open-water disposal. The eastern portion of DMMU 7 is suitable for open-water disposal based on individual core archive results and the remainder of DMMU 7 is unsuitable (See Figure 7). DMMUs 9, 10, 12 and 13 are unsuitable for open-water disposal due to failed bioassays.

A horizontal buffer between suitable DMMUs 8/11 and unsuitable DMMUs 9/10/12 must be added so that none of the suitable material sloughs into the suitable DMMUs during dredging. A similar buffer between suitable DMMU 7 and unsuitable DMMUs 9/10/12 must also be added.

An additional vertical buffer between unsuitable DMMU 7 and suitable DMMU 3 beneath is not required because the surface DMMU 7 includes an additional approximately 0.25 ft of material compared with the 2011 bathymetry. This additional 0.25 ft of material is considered an adequate vertical buffer given the nature of the unsuitable material (benzyl alcohol exceedance, no bioassays).

In summary, 28,300 CY of proposed dredged material from DMMUs 1-8 and 11 are suitable for open-water disposal at the Elliott Bay disposal site. 11,350 CY of material from DMMUs 7, 9, 10 and 12 are unsuitable for open-water disposal. All 5,150 CY of DMMU 13 are also unsuitable for open-water disposal, however, at this time DYC does not intend to pursue dredging of DMMU 13.

Antidegradation Determination

The sediment to be exposed by dredging must either meet the State of Washington Sediment Management Standards (SMS) or the State's Antidegradation Standard (Ecology, 2013) as outlined by DMMP guidance (DMMP, 2008).

An antidegradation determination was made in the 2013 for the leave surface below DMMUs 1-3. The DMMP agencies have evaluated that determination and decided that there are no changed conditions at depth and the determination is still valid. Therefore, the leave surface below DMMUs 1-3 meet anti-degradation.

The leave surface in the southern portion (beneath DMMUs 8, 9, and 10) of the marina requires further evaluation. A second subsurface DMMU, DMMU 13, was evaluated as part of this characterization and is the best representation of the quality of the leave surface. DMMU 13 triggered bioassay due to a dimethyl phthalate exceedance and the bioassays failed. In addition to the bioassay failure, Dioxin/furan concentrations in DMMU 13 was 11.5 pptr TEQ. This is less than the surface concentration in DMMU 10, but above the surface concentrations in DMMU 8 and 9 and above the bioaccumulation trigger for dioxins/furans. Therefore, due to both bioassay fails and dioxin concentrations in DMMU 13, the leave surface beneath DMMUs 8, 9 and 10 does not pass antidegradation. In these areas, since dredging deeper is not an option being considered by Duwamish Yacht Club, the following approaches will be used:

- A 1-ft buffer of material between suitable DMMU 11 and failed DMMU 13 at depths of -9 and -8 ft MLLW will be left in place.
- DMMU 12 will be dredged to a depth of -9 ft MLLW and a 1 foot layer of approved clean material will be placed.

Debris Management

The DMMP agencies implemented a debris screening requirement following the 2015 SMARM to prevent the disposal of solid waste and debris at open-water disposal sites in Puget Sound (DMMP, 2015). Marinas are known sources of debris. Per these guidelines, a 1-ft x 1-ft screening grid should be used during dredging of suitable material to remove potential debris not allowed at any DMMP disposal site. Alternate debris management plans may be submitted to the DMMP prior to dredging if it can be demonstrated that debris is unlikely to be present or that other removal options are sufficient.

Notes and Clarifications

The decisions documented in this memorandum do ***not*** constitute final agency approval of the project. During the public comment period that follows a public notice, resource agencies will provide input on the overall project. A final decision will be made after full consideration of agency input, and after an alternatives analysis is done under section 404(b)(1) of the Clean Water Act.

A pre-dredge meeting with DNR, Ecology and the Corps of Engineers is required at least 7 days prior to dredging. A dredging quality control plan must be developed and submitted to DNR, Ecology and the USACE Seattle District's Regulatory Branch and DMMO. Refer to the USACE permit and Ecology 401 certification for project-specific submittal requirements and timelines.

The DMMP does not make specific beneficial use determinations. However, these data are available for the assessment of project-specific beneficial use by the project proponent, permitting agencies, local health jurisdictions and/or the owner of a receiving property.

Notes:

DMMU = dredged material management unit

MLLW = mean lower low water

[a] Acquisition elevation = mudline elevation – length of acquired core

[b] Minimum percent recovery is 75% but 85% is the target.

[c] C48 refers to the fifth attempt of C39

Notes:

1) The design depth for DMMUs 1-31 is -8 feet MLLW

2) The design depth for DMMUs 11 and 12 is -9 feet MLLW; including 1 ft of overdredgd in case of need for 1ft sand cover for antidegradation

3) DMMU volumes have been adjusted with a 10% contingency factor for bulking and additional deposition.

Notes:
DMMP = Dredged Material Management Program
DMMU = Dredged Material Management Unit
Data Qualifiers:
J = the analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
U = the analyte was analyzed for, but was not detected above the reported sample quantitation limit.

Table 4. Analytical Results Compared to DMMP Guideline Values, Grain Size and Non-conventionals

Notes:

Shaded values represent concentration that exceed one or more of the listed DMMP criterion.

BT = bioaccumulation trigger
DL = detection limit
DMMP = Dredged Material Management Program
DMMU = Dredged Material Management Unit
HPAH = high molecular weight polycyclic aromatic hydrocarbons
LPAH = low molecular weight polycyclic aromatic hydrocarbons
µg/kg = microgram per kilogram
mg/kg = milligram per kilogram
ML = maximum limit
ND = non-detect
ng/kg = nanogram per kilogram
PCB = polychlorinated biphenyl
SL = screening level
TEQ = toxicity equivalence
TOCN = total organic carbon normalized

Data Qualifiers:

J = the analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

U = the analyte was analyzed for, but was not detected above the reported sample quantitation limit.

UJ = the analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

[a] Criteria from DMMP Table 8-3

[b] Total LPAH includes naphthalene, acenaphthylene, acenaphthene, fluorene, phenanthrene, and anthracene.

[c] Total benzofluoranthenes represents the sum of the concentrations of the "B," "J," and "K" isomers.

[d] Total HPAH includes fluoranthene, pyrene, benz[a]anthracene, chrysene, total benzofluoranthenes, benzo[a]yrene, indeno[1,2,3-cd]pyrene, dibenz[a,h]anthracene, and benzo[ghi]perylene.

[e] Total chlordane includes cis-chlordane, trans-chlordane, cis-nonachlor, trans-nonachlor, and oxychlordane.

[f] This value is normalized to total organic carbon and is expressed in mg/kg carbon.

[g] Puget Sound only.
